# Kubernetes 101 for Python Programmers

Learn the ABCs of Kubernetes and how to get started on using managed containers for your python development on your local machine and also for production deployments on a cloud provider-managed Kubernetes cluster.

# Tutorial Agenda

- 1. Background
  - Docker container runtime
- 2. Kubernetes Architecture & Components
- 3. Kubernetes for Managed Containers
  - Replicasets, services, deployments, configmaps and secrets
  - Django application with K8s scaling, updating code
- 4. Further reading

# Bare-metal, Virtual Machines, Containers

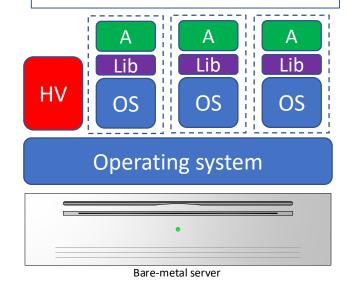

#### **Bare Metal**

- Weak encapsulation
- Long install/start-up times
- Ideal for single application e.g. a Hadoop node
- Hard to right-size

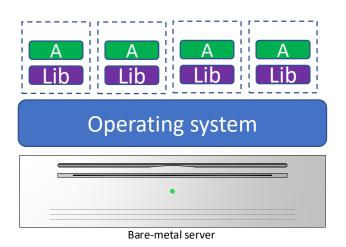

#### Virtual machines

- Strong encapsulation
- Hardware emulation overhead (per VM)
- Per-VM operating system overhead
- Long install/start-up times

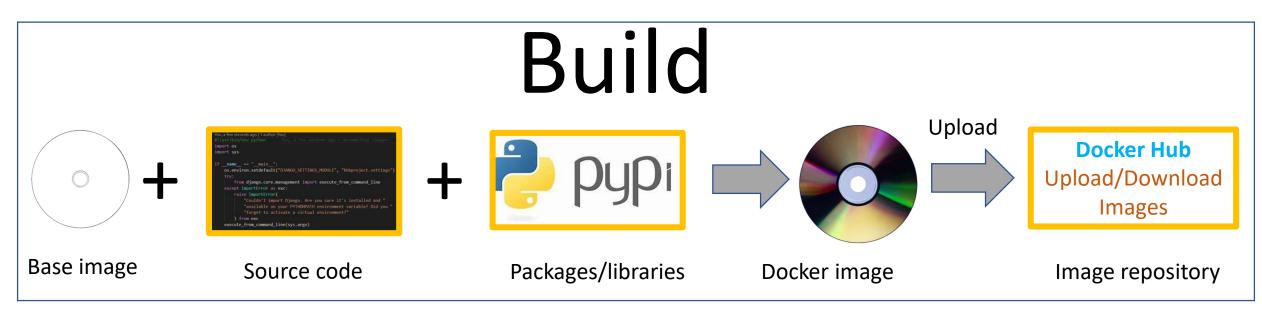

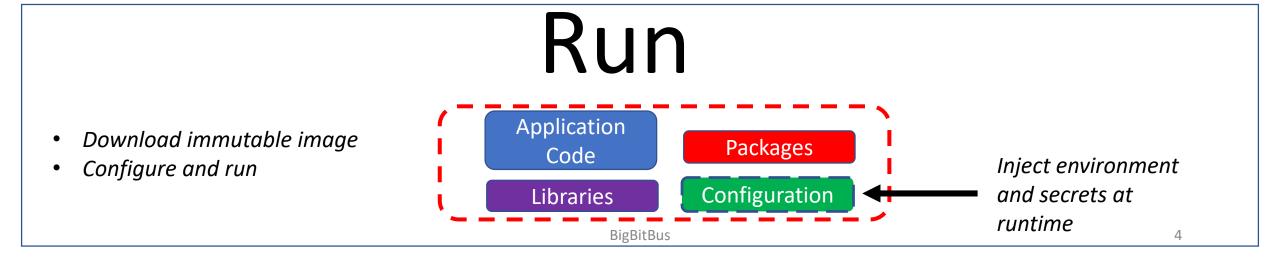

#### **Containers**

- Encapsulation *lite*
- Small overhead only single kernel running
- Smaller deployment artifacts expressed as code
- Quick start-up times

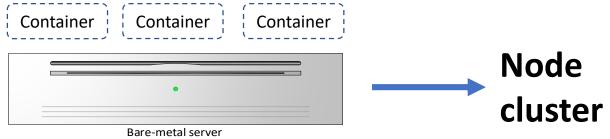

## Docker – container runtime

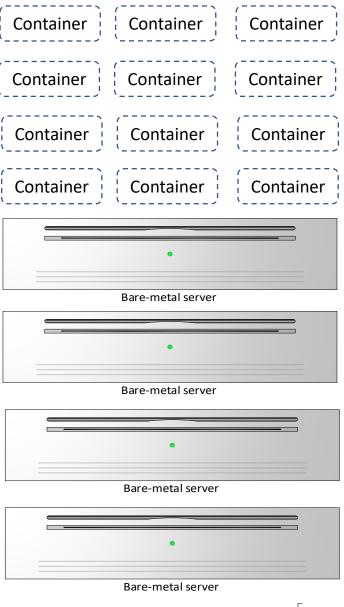

# Beyond Single Node Docker

Single node

Multi-node production scale-out?

- 1. High-availability
- 2. Horizontal scalability

# Beyond Manual Containers

# Infrastructure Abstraction

Different hardware, cloud providers, networks & storage

#### **Multi-tenancy**

Multiple service and users isolation

#### **Scalability**

Run multiple pod replicas and load-balance across them

#### **Rolling Updates**

Update code without disruption

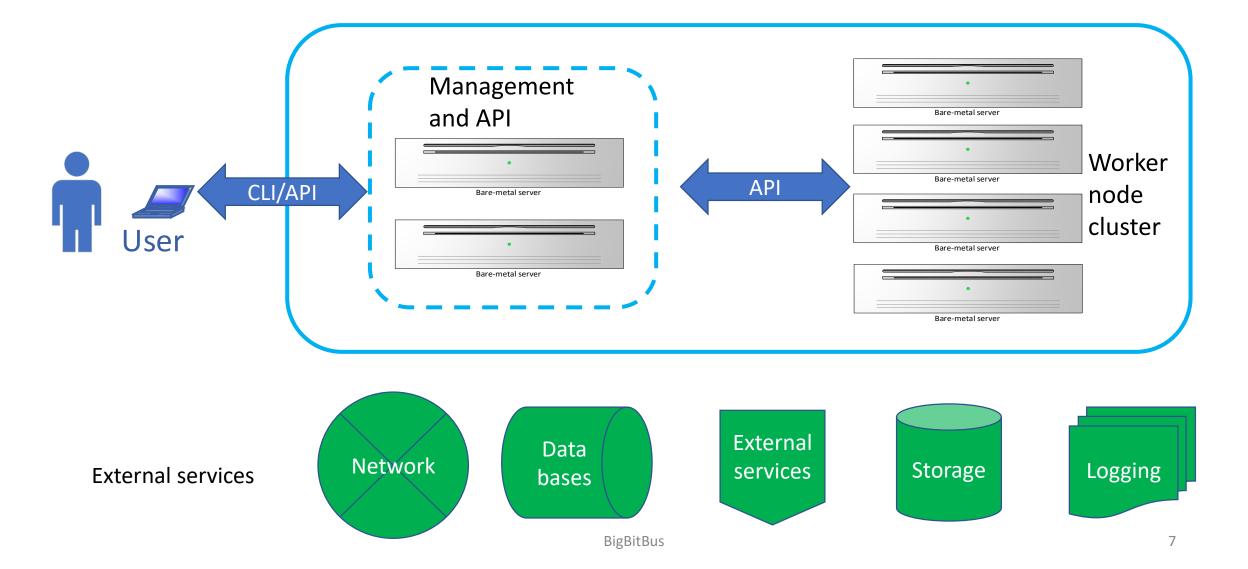

#### **Service Discovery**

Correct request routing under dynamic pods/cluster

#### **Context & Secrets**

Inject env-vars and secrets into target pods

# **Kubernetes Cluster**

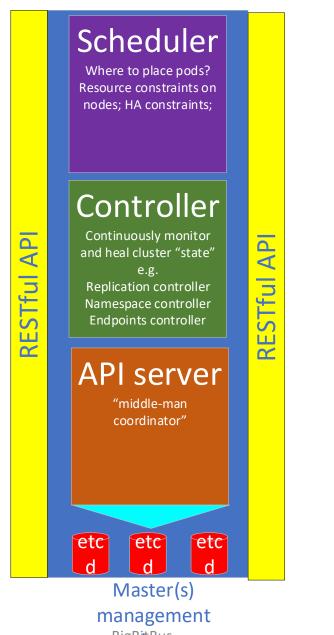

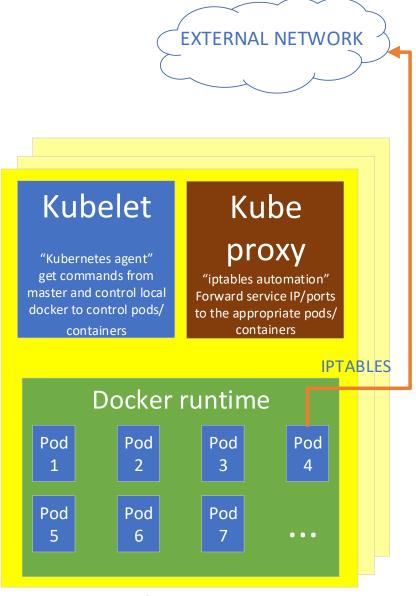

# Kubernetes Architecture

#### Multiple components

- Management plane
- Worker plane

Worker nodes can be baremetal or virtual machines

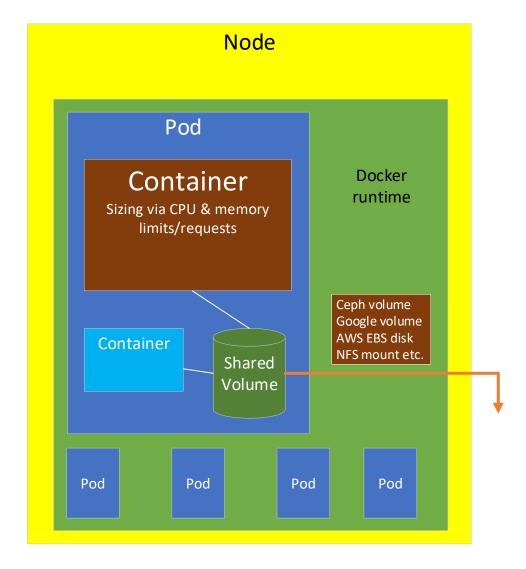

Nodes – servers running Kubernetes workers

#### Pod

- The smallest independent "unit" of infrastructure in K8s
  - Scaling/redundancy
- A logical "host"
- Multiple containers & volumes
- Localhost and IPC connectivity
- <u>Cannot</u> span nodes

Application server + local cache

# Replicasets (of pods)

 Keep a defined number of identical pod replicas running in the Kubernetes cluster

Example: We need 10 identical Django pods running at any time.

(schedule 2 new pods)

Scheduler - create/ destroy pods

Current state (8 pods) Reconciliation loop

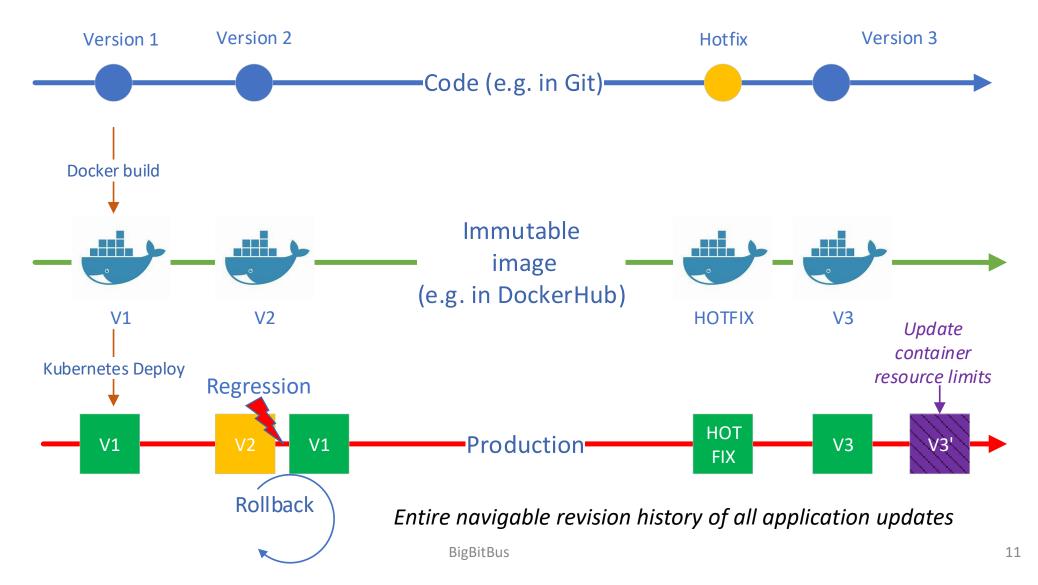

Desired state

Scaling up/down and Failures

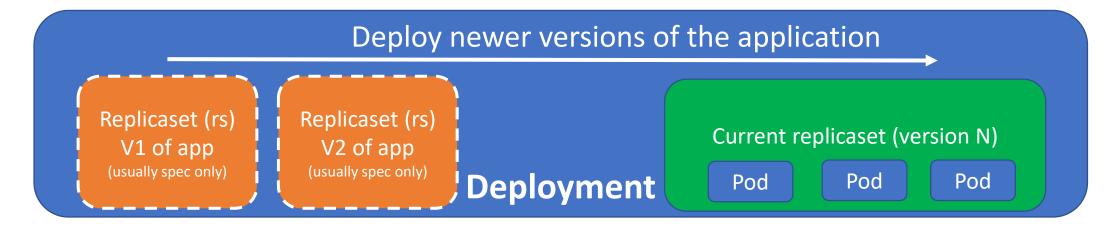

(a node hosting 2 pods dies)

#### Application updates, rollbacks, jumps to any revision

# Deployments

# Deployment defined in YAML

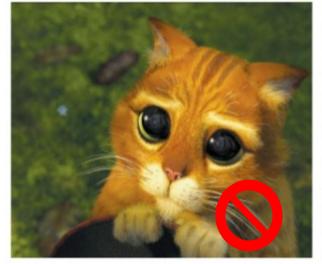

- Deployments help manage application versions
  - Click <u>here</u> to see the Django deployment yaml file
  - Click <u>here</u> to see the Postgres deployment yaml file
- A new replicaset is created every time the deployment changes
- Deleting deployments will delete the underlying replica-sets and pods

## Services

Services route traffic to the appropriate pods within the k8s cluster

#### Service Flavors

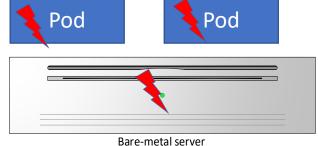

- 1. <u>Cluster-IP</u>: a service to which other services within the cluster connect. <u>Example</u>
- 2. <u>Load balancer</u>: Expose service externally (Load-balancer). <u>Example</u>
- 3. <u>External Name</u>: Connect to an external service. <u>Example</u>

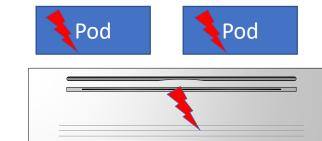

Pods are "cattle" - expendable, replaceable - not pets

Underlying pods and hardware are ephemeral and very dynamic

Bare-metal server

BigBitBus 13

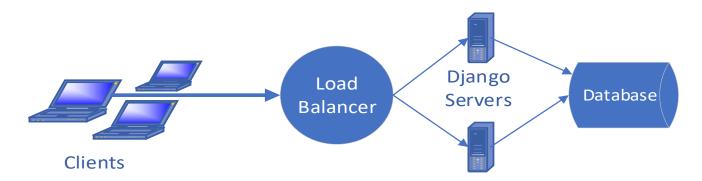

## **Environment Variables & Secrets**

- Inject meta-data into pods, e.g. based on namespace
- Configmaps for environment variables
  - Example (<u>development</u> & <u>production</u> namespace)
- Secrets
  - Create a secret

```
kubectl create secret generic db-password --from-literal=db-password=superSecret
```

• Expose secret inside pod as an environment variable

# Polls Application Example

- Stateless Django servers (cattle)
- All state data stored in database (pet)

#### **Polling Application in Browser**

#### State definition - models.py

# Polls • What is cool about Python? • Which cloud provider is the best? • Which star wars movie was the best? Which cloud provider is the best? Which cloud provider is the best? Obigital Ocean Linode Google Cloud Amazon Web Services Microsoft Azure Other Vote

```
class Poll(models.Model):
    question = models.CharField(max_length=200)

def __str__(self):  # Python 3: def __unicode__(self):
    return self.question

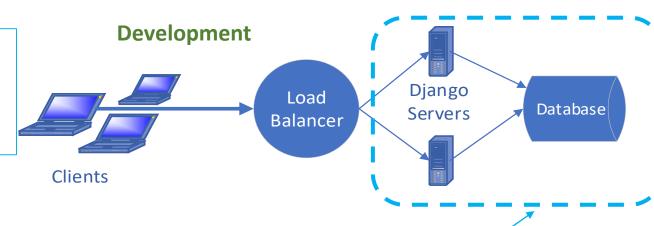

class Choice(models.Model):
    poll = models.ForeignKey(Poll, on_delete=models.CASCADE)
    choice_text = models.CharField(max_length=200)
    votes = models.IntegerField(default=0)

def __str__(self):  # Python 3: def __unicode__(self):
    return self.choice_text
```

# Database Placement Options

#### **Development**

 Helps improve development and production code parity.

#### **Production**

 Leave the stateful DB maintenance heavylifting to the experts.

# Production Load Balancer Django Servers Database Service

Kubernetes cluster

Django settings.py example

**Developer workflow example** 

## Kubectl – Kubernetes CLI

#### kubectl --help

• Wrapper around RESTful API: GET, CREATE, DEPLOY etc. action-words

```
kubectl get nodes
kubectl get nodes -o wide
kubectl get node minikube -o yaml
```

More information, yaml or json

```
kubectl config get-contexts
kubectl config use-context aws
kubectl get nodes
```

The same kubectl can point to multiple k8s clusters

```
kubectl create namespace development
kubectl get namespaces
kubectl --namespace development get pods
```

Virtual k8s cluster via namespaces

## Run a one-off Pod

```
kubectl run my-shell --rm -i --tty --image ubuntu -- bash
```

BigBitBus

```
ubuntu@ip-172-31-45-221:~$ kubectl get pods
NAME
                            READY
                                    STATUS
                                              RESTARTS
                                                          AGE
my-shell-68974bb7f7-tbfpx 1/1
                                    Running
                                                          1m
ubuntu@ip-172-31-45-221:~$ kubectl get deployments
                               UP-TO-DATE
NAME
          DESIRED
                     CURRENT
                                            AVAILABLE
                                                         \mathbf{AGE}
mv-shell 1
                     1
                               1
                                            1
                                                         1 m
ubuntu@ip-172-31-45-221:~$ kubectl delete deployment my-shell
deployment.extensions "my-shell" deleted
ubuntu@ip-172-31-45-221:~$ kubectl get pods
No resources found.
```

A pod is created, a
A deployment is also created
Cascading delete – pod also deleted

Inside the pod
Just like a "normal" Linux box

```
root@my-shell-68974bb7f7-tbfpx:/# cat /etc/hosts
# Kubernetes-managed hosts file.
127.0.0.1 localhost
::1 localhost ip6-localhost ip6-loopback
fe00::0 ip6-localnet
fe00::0 ip6-mcastprefix
fe00::1 ip6-allnodes
fe00::2 ip6-allrouters
172.17.0.5 my-shell-68974bb7f7-tbfpx
root@my-shell-68974bb7f7-tbfpx:/#
```

Running one-off pods is not the Kubernetes use-case

# Demo – update the django application code

# Explore Further

- <u>Labels</u> and <u>Annotations</u>: Very powerful construct to filter and track K8s resources: Required reading!
- Horizontal pod autoscaling: Triggers for pod quantity adjustment
- <u>Statefulsets</u> (instead of replicasets): Customizing individual pods in a deployment e.g. to take on different roles.
- Persistent volumes: Attach block devices to pods
- Jobs and Cronjobs: Running one-off tasks or periodic pods.

# Appendix

# Kubernetes Anti-patterns

- Large pods avoid making pets!
- Imperative kubectl commands instead of declarative yaml
- Single namespace for multiple environments
- Lack of consistent names (images/deployments/services etc.)
- Single cluster for development and production
- Missing application-level health-checks
- Missing cluster-level (node) auto-scaling

#### Cost Math

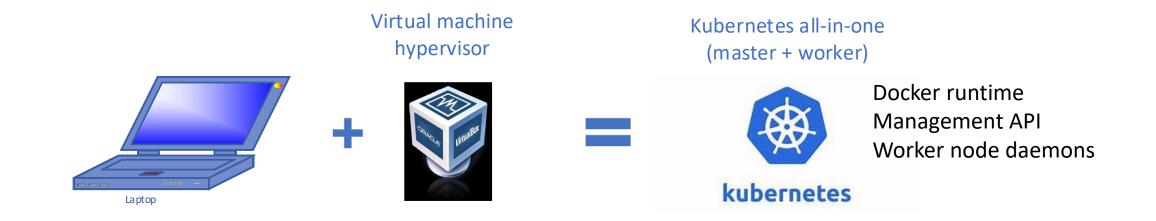

#### Cloud provider

- Master API server Currently (11/2018) \$0.20/hour per Amazon EKS cluster (\$1,752 annually)
- Add worker node VMs cost
- You still need to buy all the storage/load balancers/IP addresses etc.

#### Minikube

- Free, but needs a good PC capable of running a fairly big VM.
- No high availability this is only for development work

# Minikube: Kubernetes on your Laptop

- Installation instructions for Windows, Mac and Linux <a href="https://kubernetes.io/docs/tasks/tools/install-minikube/">https://kubernetes.io/docs/tasks/tools/install-minikube/</a>
- Default: 2 cores + 2 GB RAM = capable of running a few containers

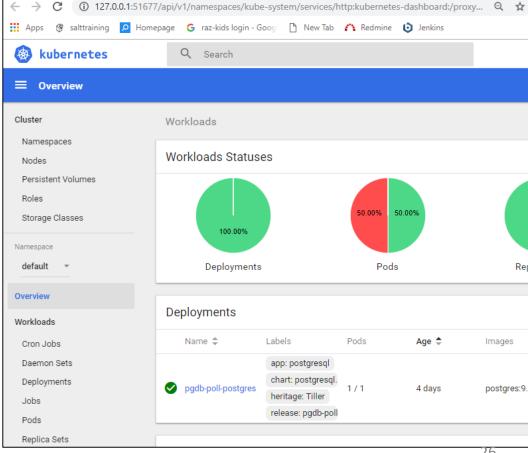

# Starting minikube

#### minikube cli

```
# start minikube, launch VM
$ minikube start
# check minikube status
 minikube status
 start minikube GUI
$ minikube dashboard
```

```
capacity:
  ephemeral-storage: 16888216Ki
hugepages-2Mi: "0"
  memory: 2038624Ki
  pods: "110"
```

#### **Dashboard** General-purpose web UI for Kubernetes clusters

# Beyond Manual Containers

#### 1. Multiple node container runtime cluster

- Load-balancing across multiple containers
- Service discovery
- Fairness and resource sharing among different applications

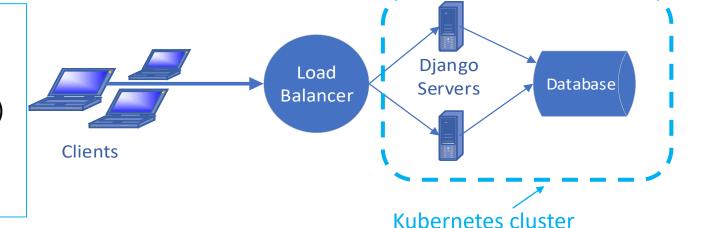

#### 2. Production Operations Management

- Application updates & versioning
- Monitoring for failures; auto-healing
- Autonomous behavior autoscaling and repairs
- Dealing with Failures
- Role based access controls
- Zero-downtime upgrades

# Stateful Databases in Kubernetes (?)

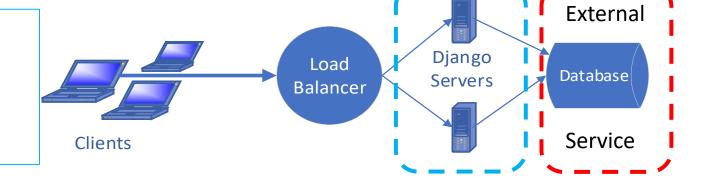

#### **Option 1**

- Kubernetes provides constructs for this (stateful sets, volumes, etc.)
- Possible cost saving (bin packing containers)
- Is self-managed state worth your developer/SRE time?

#### Option 2

- Use cloud-provider stateful solutions
  - AWS RDS, Google cloudsql, etc.
- Expensive, but much less operations tasks

# **BigBitBus**

Transparency in public cloud and big data/analytics
